

Circular expander patented for ratchet device

In order to avoid stripes on the fabric which might be created by the pressure of the roller head of the circular expander to the fabric which is running between roller head and fixation roll, DORNIER has developed a ratchet device (patented). Thereby the distance between roller head and upper fixation rolls are automatically limited

to about 5 mm, enabling the fabric a smooth run between roller head and upper fixation rolls.

The range of machinery and equipment is to be complemented in the near future by a circular squeezer, currently undergoing trials, for the dewatering or the dyeing of tubular fabric. These developments effectively underline Dornier's competence as your partner in the field of tubular knit finishing.
